

## Brainstorming & Idea Prioritization Template

|                      |                                       |
|----------------------|---------------------------------------|
| <b>Date</b>          | 25 June 2026                          |
| <b>Team ID</b>       |                                       |
| <b>Project Name</b>  | A Comprehensive Measure of Well-Being |
| <b>Maximum Marks</b> | 3 Marks                               |

### Step 1: Brainstorm and Idea Listing

Each team member lists out as many ideas as possible without judging them at this stage.

| S.No | Team Member  | Idea / Suggestion                                                                                                                                                     | Category               | Group No. |
|------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|-----------|
| 1    | G.J.K.VAMSI  | Use a Multiple Linear Regression model because the relationship between HDI and indicators like life expectancy and schooling is highly linear and easy to interpret. | Machine Learning Model | 1         |
| 2    | G.LOKESH     | Try a complex ensemble model like XGBoost to capture potential non-linear data patterns.                                                                              | Machine Learning Model | 1         |
| 3    | CH.AKSHAYA   | Build a Flask backend API to connect our ML model to a web interface.                                                                                                 | Backend / Deployment   | 2         |
| 4    | Y.AJAY KUMAR | Create an interactive frontend using HTML/CSS/JavaScript where users can input Life Expectancy, Education, and GNI using sliders.                                     | User Interface (UI)    | 2         |

|   |          |                                                                                                                                 |                 |   |
|---|----------|---------------------------------------------------------------------------------------------------------------------------------|-----------------|---|
| 5 | Y.SRIRAM | Use historical datasets from the United Nations Development Programme (UNDP) and apply Simple Imputer to handle missing values. | Data Processing | 3 |
|---|----------|---------------------------------------------------------------------------------------------------------------------------------|-----------------|---|

## Step 2: Idea Prioritization

### Brainstorming & Idea Prioritization Template

Rate each group idea on feasibility and importance ,then select the final idea(s) to move forward with.

| Group No. | Final Idea                                                                                                                                  | Feasibility (High/Medium/Low) | Importance (High/Medium/Low) | Priority | Selected (Yes/No) |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|------------------------------|----------|-------------------|
| 1         | Utilize Multiple Linear Regression. It is highly feasible, computationally fast, and provides excellent accuracy for this specific dataset. | Medium                        | High                         | 1        | Yes               |
| 2         | Develop a web dashboard with a Flask Backend and HTML/JS frontend with input sliders                                                        | High                          | High                         | 2        | Yes               |
| 3         | Source data from UNDP and implement automated handling for missing values                                                                   | High                          | High                         | 3        | Yes               |
